Sensitivity Analysis in Linear Programming

Optimization Techniques (ENGG\*6140)

School of Engineering, University of Guelph, ON, Canada

Course Instructor: Benyamin Ghojogh Winter 2023

Consider *n* variables and *m* constraints (excluding the constraints for  $x_1, \ldots, x_n \ge 0$ ). After having slack variables, we can have:

 $\begin{array}{ll} \underset{x_1,\ldots,x_n}{\text{maximize}} & c = c_1 x_1 + \cdots + c_n x_n \\ \text{subject to} & a_{11} x_1 + \cdots + a_{1n} x_n = b_1, \\ & a_{21} x_1 + \cdots + a_{2n} x_n = b_2, \\ & \vdots \\ & a_{m1} x_1 + \cdots + a_{mn} x_n = b_m, \\ & x_1,\ldots,x_n \geq 0. \end{array}$ 

Example:

$$\begin{array}{ll} \underset{x_{1},x_{2},x_{3}}{\text{maximize}} & c = 60x_{1} + 30x_{2} + 20x_{3} \\ \text{subject to} & 8x_{1} + 6x_{2} + x_{3} \leq 48, \\ & 4x_{1} + 2x_{2} + 1.5x_{3} \leq 20, \\ & 2x_{1} + 1.5x_{2} + 0.5x_{3} \leq 8, \\ & x_{1}, x_{2}, x_{3} \geq 0. \end{array}$$

It is converted to:

$$\begin{array}{ll} \underset{x_{1},x_{2},x_{3},s_{1},s_{2},s_{3}}{\text{maximize}} & c = 60x_{1} + 30x_{2} + 20x_{3} \\ \text{subject to} & 8x_{1} + 6x_{2} + x_{3} + s_{1} = 48, \\ & 4x_{1} + 2x_{2} + 1.5x_{3} + s_{2} = 20, \\ & 2x_{1} + 1.5x_{2} + 0.5x_{3} + s_{3} = 8, \\ & x_{1}, x_{2}, x_{3}, s_{1}, s_{2}, s_{3} \geq 0. \end{array}$$

$$\begin{array}{ll} \underset{x_{1},x_{2},x_{3},s_{1},s_{2},s_{3}}{\text{maximize}} & c = 60x_{1} + 30x_{2} + 20x_{3} \\ \text{subject to} & 8x_{1} + 6x_{2} + x_{3} + s_{1} = 48, \\ & 4x_{1} + 2x_{2} + 1.5x_{3} + s_{2} = 20, \\ & 2x_{1} + 1.5x_{2} + 0.5x_{3} + s_{3} = 8, \\ & x_{1}, x_{2}, x_{3}, s_{1}, s_{2}, s_{3} \geq 0. \end{array}$$

Assume we solve it until the end and at the end, the basic variables are  $s_1, x_3, x_1$  and the non-basic variables are  $x_2, s_2, s_3$ .

basic and non-basic variables:

$$\mathbf{x}_b := [\mathbf{s}_1, x_3, x_1]^{\top}, \mathbf{x}_n := [x_2, s_2, s_3]^{\top}$$

• the coefficients of basic and non-basic variables in the objective function:

$$\boldsymbol{c}_b := [0, 20, 60]^\top, \boldsymbol{c}_n := [30, 0, 0]^\top$$

• the coefficients of the variables in the constraints:

$$\begin{split} & \boldsymbol{a}_{x_1} := [8,4,2]^\top, \, \boldsymbol{a}_{x_2} := [6,2,1.5]^\top, \, \boldsymbol{a}_{x_3} := [1,1.5,0.5]^\top, \\ & \boldsymbol{a}_{s_1} := [1,0,0]^\top, \, \boldsymbol{a}_{s_2} := [0,1,0]^\top, \, \boldsymbol{a}_{s_3} := [0,0,1]^\top, \\ & \boldsymbol{b} := [48,20,8]^\top \end{split}$$

$$\begin{array}{ll} \underset{x_{1},x_{2},x_{3},s_{1},s_{2},s_{3}}{\text{maximize}} & c = 60x_{1} + 30x_{2} + 20x_{3} \\ \text{subject to} & 8x_{1} + 6x_{2} + x_{3} + s_{1} = 48, \\ & 4x_{1} + 2x_{2} + 1.5x_{3} + s_{2} = 20, \\ & 2x_{1} + 1.5x_{2} + 0.5x_{3} + s_{3} = 8, \\ & x_{1}, x_{2}, x_{3}, s_{1}, s_{2}, s_{3} \geq 0. \end{array}$$

basic and non-basic variables:

$$\mathbf{x}_b := [\mathbf{s}_1, x_3, x_1]^\top, \mathbf{x}_n := [x_2, s_2, s_3]^\top$$

• the coefficients of the variables in the constraints:

$$m{a}_{x_1} := [8,4,2]^{ op}, m{a}_{x_2} := [6,2,1.5]^{ op}, m{a}_{x_3} := [1,1.5,0.5]^{ op}, \ m{a}_{s_1} := [1,0,0]^{ op}, m{a}_{s_2} := [0,1,0]^{ op}, m{a}_{s_3} := [0,0,1]^{ op}$$

• the matrices of coefficients of the variables in the constraints, for basic and non-basic variables:  $\boldsymbol{B} \in \mathbb{R}^{m \times m}$ ,  $\boldsymbol{N} \in \mathbb{R}^{m \times (n-m)}$ 

$$\boldsymbol{B} := [\boldsymbol{a}_{s_1}, \boldsymbol{a}_{x_3}, \boldsymbol{a}_{x_1}] = \begin{bmatrix} 1 & 1 & 8 \\ 0 & 1.5 & 4 \\ 0 & 0.5 & 2 \end{bmatrix} \qquad \boldsymbol{N} := [\boldsymbol{a}_{x_2}, \boldsymbol{a}_{s_2}, \boldsymbol{a}_{s_3}] = \begin{bmatrix} 6 & 0 & 0 \\ 2 & 1 & 0 \\ 1.5 & 0 & 1 \end{bmatrix}$$

$$B^{-1}a_{j} \implies B^{-1}N = \begin{bmatrix} -2 & 2 & -8 \\ -2 & 2 & -4 \\ 5/4 & -1/2 & 3/2 \end{bmatrix}, B^{-1}B = I,$$

$$c_{b}^{\top}B^{-1}a_{j} - c_{j} \implies$$

$$c_{b}^{\top}B^{-1}N - c_{n}^{\top} = [0, 20, 60] \begin{bmatrix} -2 & 2 & -8 \\ -2 & 2 & -4 \\ 5/4 & -1/2 & 3/2 \end{bmatrix} - [30, 0, 0] = [5, 10, 10],$$

$$c_{n}^{\top}B^{-1}B - c_{n}^{\top} = \mathbf{0}^{\top}.$$

$$c_{b}^{\top}B^{-1}b = [0, 20, 60] \begin{bmatrix} 24 \\ 8 \\ 2 \end{bmatrix} = 280.$$

Cases for Sensitivity Analysis

- Sensitivity analysis analyzes how much effect some change in something has on the optimization.
- We can have different cases of change in linear programming:
  - Change in coefficient of a variable (basic or nonbasic) in the objective function
    - \* 1-1: change for **nonbasic** variable
    - ★ 1-2: change for **basic** variable
  - Change in coefficient of a variable (basic or nonbasic) in the constraint(s)
    - ★ 2-1: change for nonbasic variable
    - ★ 2-2: change for basic variable
  - adding a new variable to optimization
    - adding a new constraint to optimization

Note: we can have a combination of changes, too!

Case 1-1 of Change

\* Change in coefficient of a nonbasic variable in the objective function.

Example: The company has profits \$60, \$30, and \$20 for the first, second, and third products. The resources for these products have the following restrictions:  $8x_1 + 6x_2 + x_3 \le$  \$48,  $4x_1 + 2x_2 + 1.5x_3 \le$  \$20, and  $2x_1 + 1.5x_2 + 0.5x_3 \le$  \$8.

$\begin{array}{c} maximize \\ {}^{x_1,x_2,x_3,s_1,s_2,s_3} \end{array}$	$c = 60x_1 + 30x_2 + 20x_3$
subject to	$8x_1 + 6x_2 + x_3 + s_1 = 48,$
	$4x_1 + 2x_2 + 1.5x_3 + s_2 = 20,$
	$2x_1 + 1.5x_2 + 0.5x_3 + s_3 = 8$
	$x_1, x_2, x_3, s_1, s_2, s_3 \ge 0.$

The company is able to increase the profit of the second product,  $x_2$ , to (a) \$32 and (b) \$36. Do you recommend this change to the manager?

\* Change in coefficient of a nonbasic variable in the objective function.

$$\boldsymbol{x}_b := [\boldsymbol{s}_1, x_3, x_1]^{\top}, \boldsymbol{x}_n := [x_2, s_2, s_3]^{\top}, \boldsymbol{c}_b := [0, 20, 60]^{\top}, \boldsymbol{c}_n := [30, 0, 0]^{\top}$$

 $\boldsymbol{x}_2$  is a nonbasic variable. We have change in  $\boldsymbol{c}_{\boldsymbol{x}_2}$  in  $\boldsymbol{c}_n$  so:

$$\boldsymbol{c}_{b}^{\top}\boldsymbol{B}^{-1}\boldsymbol{a}_{\boldsymbol{x}_{2}}-\boldsymbol{c}_{\boldsymbol{x}_{2}}=\left[0,20,60\right]\begin{bmatrix}-2\\-2\\5/4\end{bmatrix}-(30+\delta)=35-30-\delta=5-\delta$$

For not having change in optimization:

$$5-\delta \ge 0 \implies \delta \le 5 \implies c_{\mathbf{x}_2,\mathsf{new}} = 30 + \delta \le 35.$$

- For not having change in optimization:  $5 \delta \ge 0 \implies \delta \le 5 \implies c_{x_2,new} = 30 + \delta \le 35$ .
- Therefore, if profit of  $x_2$  is \$32  $\leq$  \$35, we do not recommend it as it does not change the previous optimal solution for production of the company.
- If profit of x<sub>2</sub> is \$36 > \$35, we should continue the optimization:

Case 1-2 of Change

\* Change in **coefficient** of a **basic** variable in the **objective function**.

Example: The company has profits \$60, \$30, and \$20 for the first, second, and third products. The resources for these products have the following restrictions:  $8x_1 + 6x_2 + x_3 \le$  \$48,  $4x_1 + 2x_2 + 1.5x_3 \le$  \$20, and  $2x_1 + 1.5x_2 + 0.5x_3 \le$  \$8.

$\begin{array}{c} maximize \\ {}^{x_1,x_2,x_3,s_1,s_2,s_3} \end{array}$	$c = 60x_1 + 30x_2 + 20x_3$
subject to	$8x_1 + 6x_2 + x_3 + s_1 = 48,$
	$4x_1 + 2x_2 + 1.5x_3 + s_2 = 20,$
	$2x_1 + 1.5x_2 + 0.5x_3 + s_3 = 8,$
	$x_1, x_2, x_3, s_1, s_2, s_3 > 0.$

The company is decreasing the profit of the first product,  $x_1$ , to (a) \$58 and (b) \$30. Do you recommend this change to the manager?

$$\begin{array}{c|c} & \chi_n^T & \chi_B^T & RHS \\ \hline \chi_g & \bar{B}_a^{J} = \bar{B}^{1} N & \bar{B}_{aj}^{J} = \bar{B}^{1} B = I & B^{-1} B \\ \hline c & \bar{c}_b^{+} \bar{B}_{aj}^{-} - \bar{c}_{j}^{-1} & O^{+} \\ \hline \chi_g^{+} \bar{b}_{N-} - \bar{c}_{k}^{-1} & O^{+} \\ \hline \bar{c}_{k}^{+} \bar{B}_{N-} - \bar{c}_{k}^{-1} & \bar{c}_{k}^{-} \bar{B}^{-1} \bar{b}_{k} \end{array}$$

$$\boldsymbol{x}_b := [\boldsymbol{s}_1, x_3, x_1]^\top, \boldsymbol{x}_n := [x_2, s_2, s_3]^\top, \boldsymbol{c}_b := [0, 20, 60]^\top, \boldsymbol{c}_n := [30, 0, 0]^\top$$

 $x_1$  is a basic variable. We have change in  $c_{x_1}$  in  $c_b$  so:

$$\boldsymbol{c}_{b}^{\top} \boldsymbol{B}^{-1} \boldsymbol{N} - \boldsymbol{c}_{n}^{\top} = [0, 20, 60 + \delta] \begin{bmatrix} -2 & 2 & -8 \\ -2 & 2 & -4 \\ 5/4 & -1/2 & 3/2 \end{bmatrix} - [30, 0, 0]$$
$$= [5 + 1.25\delta, 10 - 0.5\delta, 10 + 1.5\delta]$$

For not having change in optimization:

$$\begin{split} 5+1.25\delta &\geq 0 \implies \delta \geq -4, \quad 10-0.5\delta \geq 0 \implies \delta \leq 20, \quad 10+1.5\delta \geq 0 \implies \delta \geq -6.6, \\ \implies -4 \leq \delta \leq 20, c_{\mathbf{x}_1} = 60 + \delta \implies 56 \leq c_{\mathbf{x}_1} \leq 80. \end{split}$$

- For not having change in optimization:  $56 \le c_{x_1} \le 80$ .
- Therefore, if profit of x₁ decreases to \$58 ∈ [56, 80], this decrease does not change the overall profit and it can be recommended.
- If profit of  $x_1$  is decreased to \$30 < \$56, we should continue the optimization:

$$\boldsymbol{c}_{b}^{\top}\boldsymbol{B}^{-1}\boldsymbol{N} - \boldsymbol{c}_{n}^{\top} = [0, 20, 30] \begin{bmatrix} -2 & 2 & -8 \\ -2 & 2 & -4 \\ 5/4 & -1/2 & 3/2 \end{bmatrix} - [30, 0, 0] = [-32.5, 25, -35],$$
$$\boldsymbol{c}_{b}^{\top}\boldsymbol{B}^{-1}\boldsymbol{b} = [0, 20, 30] \begin{bmatrix} 24 \\ 8 \\ 2 \end{bmatrix} = 220.$$

So, changing profit of  $x_1$  to \$30 decreases the total profit to \$272 from \$280.

Case 2-1 of Change

\* change in **coefficient** of a **nonbasic** variable in the **constraint(s)**.

Example: The company has profits \$60, \$30, and \$20 for the first, second, and third products. The resources for these products have the following restrictions:  $8x_1 + 6x_2 + x_3 \le$  \$48,  $4x_1 + 2x_2 + 1.5x_3 \le$  \$20, and  $2x_1 + 1.5x_2 + 0.5x_3 \le$  \$8.

$\underset{x_1,x_2,x_3,s_1,s_2,s_3}{maximize}$	$c = 60x_1 + 30x_2 + 20x_3$
subject to	$8x_1 + 6x_2 + x_3 + s_1 = 48,$
	$4x_1 + 2x_2 + 1.5x_3 + s_2 = 20,$
	$2x_1 + 1.5x_2 + 0.5x_3 + s_3 = 8,$
	$x_1, x_2, x_3, s_1, s_2, s_3 \ge 0.$

The company is changing the resources for  $x_2$  as  $8x_1 + 5x_2 + x_3 \le $48$ ,  $4x_1 + 2x_2 + 1.5x_3 \le $20$ , and  $2x_1 + 4x_2 + 0.5x_3 \le $8$ . Also, the company is changing the profit of that product to 50. What is your recommendation to the manager?

$$\boldsymbol{x}_b := [\boldsymbol{s}_1, x_3, x_1]^{\top}, \boldsymbol{x}_n := [x_2, \boldsymbol{s}_2, \boldsymbol{s}_3]^{\top}, \boldsymbol{c}_b := [0, 20, 60]^{\top}, \boldsymbol{c}_n := [30, 0, 0]^{\top}$$

 $x_2$  is a nonbasic variable. We have change in  $a_{x_2}$  in **N**, and a change in  $c_{x_2}$  so:

$$oldsymbol{c}_b^{ op} oldsymbol{B}^{-1} oldsymbol{a}_{\mathbf{x}_2} - c_{\mathbf{x}_2} = [0, 20, 60] \begin{bmatrix} 1 & 2 & -8 \\ 0 & 2 & -4 \\ 0 & -0.5 & 1.5 \end{bmatrix} \begin{bmatrix} 5 \\ 2 \\ 4 \end{bmatrix} - 50 = 10 \ge 0.$$

It does not change the optimal solution so it does not change the total profit. If that would become negative, we should have continued the table!

Case 2-2 of Change

\* change in **coefficient** of a **basic** variable in the **constraint(s)**.

Example: The company has profits \$60, \$30, and \$20 for the first, second, and third products. The resources for these products have the following restrictions:  $8x_1 + 6x_2 + x_3 \le$  \$48,  $4x_1 + 2x_2 + 1.5x_3 \le$  \$20, and  $2x_1 + 1.5x_2 + 0.5x_3 \le$  \$8.

$\begin{array}{c} maximize \\ {}^{x_1,x_2,x_3,s_1,s_2,s_3} \end{array}$	$c = 60x_1 + 30x_2 + 20x_3$
subject to	$8x_1 + 6x_2 + x_3 + s_1 = 48,$
	$4x_1 + 2x_2 + 1.5x_3 + s_2 = 20,$
	$2x_1 + 1.5x_2 + 0.5x_3 + s_3 = 8,$
	$x_1, x_2, x_3, s_1, s_2, s_3 > 0.$

The company is changing the resources for  $x_1$  as  $5x_1 + 6x_2 + x_3 \le$ \$48,  $5x_1 + 2x_2 + 1.5x_3 \le$ \$20, and  $x_1 + 1.5x_2 + 0.5x_3 \le$ \$8. What is your recommendation to the manager?

$$\boldsymbol{x}_b := [\boldsymbol{s}_1, x_3, x_1]^{\top}, \, \boldsymbol{x}_n := [x_2, s_2, s_3]^{\top}, \, \boldsymbol{c}_b := [0, 20, 60]^{\top}, \, \boldsymbol{c}_n := [30, 0, 0]^{\top}.$$

Previous  $\boldsymbol{B}$  was:  $\boldsymbol{B} = \begin{bmatrix} 1 & 1 & 8 \\ 0 & 1.5 & 4 \\ 0 & 0.5 & 2 \end{bmatrix}$ .  $\boldsymbol{x}_1$  is a basic variable. We have change in  $\boldsymbol{a}_{\mathbf{x}_1}$  in  $\boldsymbol{B}$ , so:

$$\boldsymbol{c}_{b}^{\top} \boldsymbol{B}^{-1} \boldsymbol{N} - \boldsymbol{c}_{n}^{\top} = [0, 20, 60] \begin{bmatrix} 1 & 1 & 5 \\ 0 & 1.5 & 5 \\ 0 & 0.5 & 1 \end{bmatrix}^{-1} \begin{bmatrix} 5 \\ 2 \\ 4 \end{bmatrix} - \begin{bmatrix} 30 \\ 0 \\ 0 \end{bmatrix}.$$

We compute it. If any of the values becomes negative, we should continue the table; otherwise, the total profit does not change.

Case 3 of Change

\* adding a new variable to optimization.

Example: The company has profits \$60, \$30, and \$20 for the first, second, and third products. The resources for these products have the following restrictions:  $8x_1 + 6x_2 + x_3 \le$  \$48,  $4x_1 + 2x_2 + 1.5x_3 \le$  \$20, and  $2x_1 + 1.5x_2 + 0.5x_3 \le$  \$8.

$\begin{array}{c} maximize \\ x_1, x_2, x_3, s_1, s_2, s_3 \end{array}$	$c = 60x_1 + 30x_2 + 20x_3$
subject to	$8x_1 + 6x_2 + x_3 + s_1 = 48,$
	$4x_1 + 2x_2 + 1.5x_3 + s_2 = 20,$
	$2x_1 + 1.5x_2 + 0.5x_3 + s_3 = 8$
	$x_1, x_2, x_3, s_1, s_2, s_3 \ge 0.$

The company is adding a new product  $x_4$  with profit (a) \$15 or (b) \$25, and the constraint coefficients  $\boldsymbol{a} = [1, 1, 1]^{\top}$ . What is your recommendation to the manager?

$$\begin{array}{c|c} x_n^T & x_B^T & \text{RHS} \\ \hline x_n & \overline{b}_a^{-1} = \overline{b}_a^{-1} N & \overline{b}_a^{-1} = \overline{b}_B^{-1} B = I & B^{-1} B \\ \hline c & \overline{c}_b^T \overline{b}_{a_j}^{-1} - \overline{c}_j^T & \overline{0}_{a_j}^T - \overline{c}_b^T \overline{b}_{a_j}^{-1} - \overline{c}_b^$$

$$\mathbf{x}_b := [\mathbf{s}_1, \mathbf{x}_3, \mathbf{x}_1]^{\top}, \mathbf{x}_n := [\mathbf{x}_2, \mathbf{s}_2, \mathbf{s}_3]^{\top}, \mathbf{c}_b := [0, 20, 60]^{\top}, \mathbf{c}_n := [30, 0, 0]^{\top}.$$

 $x_4$  is a nonbasic variable. We calculate its value in the last row of the table (if  $c_{x_4} = 15$ ):

$$oldsymbol{c}_b^{\top} oldsymbol{B}^{-1} oldsymbol{a}_{x_4} - c_{x_4} = [0, 20, 60] \begin{bmatrix} 1 & 2 & -8 \\ 0 & 2 & -4 \\ 0 & -0.5 & 1.5 \end{bmatrix} \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix} - 15 = 5 \ge 0.$$

It does not change the optimal solution so it does not change the total profit.

$$\begin{array}{c|c} x_n^T & x_B^T & \text{RHS} \\ \hline x_B & \overline{Ba} = \overline{B^T N} & \overline{Ba}_{j} = \overline{B^T B} = I & \overline{B^{-1} b} \\ \hline c & \overline{c_b^T Ba_{j}^T - c_j^T} & \overline{O^T} & \overline{c_b^T B^{-1} b} \\ \hline c_{T,\overline{B}N - C_h}^T & \overline{c_b^T B^T b} & \overline{c_b^T B^T b} \end{array}$$

$$\mathbf{x}_b := [\mathbf{s}_1, \mathbf{x}_3, \mathbf{x}_1]^{\top}, \mathbf{x}_n := [\mathbf{x}_2, \mathbf{s}_2, \mathbf{s}_3]^{\top}, \mathbf{c}_b := [0, 20, 60]^{\top}, \mathbf{c}_n := [30, 0, 0]^{\top}$$

 $x_4$  is a nonbasic variable. We calculate its value in the last row of the table (if  $c_{x_4} = 25$ ):

$$\boldsymbol{c}_{b}^{\top}\boldsymbol{B}^{-1}\boldsymbol{a}_{\boldsymbol{x}_{4}}-\boldsymbol{c}_{\boldsymbol{x}_{4}}=[0,20,60]\begin{bmatrix}1&2&-8\\0&2&-4\\0&-0.5&1.5\end{bmatrix}\begin{bmatrix}1\\1\\1\end{bmatrix}-25=-5<0.$$

We should continue the table.

$$B^{-1}a_{x_{4}} = \begin{bmatrix} 1 & 2 & -8 \\ 0 & 2 & -4 \\ 0 & -0.5 & 1.5 \end{bmatrix} \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix} = \begin{bmatrix} -5 \\ -2 \\ 1 \end{bmatrix}$$

$$\xrightarrow{s_{1} -2} \begin{bmatrix} 2 & -8 \\ -2 & -8 \end{bmatrix} \xrightarrow{s_{1}} \begin{bmatrix} x_{3} & x_{1} \\ x_{4} \end{bmatrix} \xrightarrow{s_{1}} \begin{bmatrix} x_{4} \\ -2 \end{bmatrix} \xrightarrow{s_{1}} \begin{bmatrix} x_{2} \\ -2 \end{bmatrix} \xrightarrow{s_{1}} \begin{bmatrix} x_{3} \\ -2 \end{bmatrix} \xrightarrow{s_{1}} \xrightarrow{s_{1}} \begin{bmatrix} x_{4} \\ -2 \end{bmatrix} \xrightarrow{s_{1}} \xrightarrow{s_$$

So, the optimum objective function has increased and this addition of variable in beneficial.

Case 4 of Change

\* adding a new constraint to optimization.

This can result in three sub-cases:

- 4-1: The current optimal solution satisfies the new constraint.
- 4-2: The current optimal solution **doesn't satisfy** the new constraint but linear programming still **has a feasible solution**.
- 4-3: The current optimal solution doesn't satisfy the new constraint and linear programming doesn't have a feasible solution.

Question: Can adding a constraint improve the optimum value of objective function?

Example: The company has profits \$60, \$30, and \$20 for the first, second, and third products. The resources for these products have the following restrictions:  $8x_1 + 6x_2 + x_3 \le$  \$48,  $4x_1 + 2x_2 + 1.5x_3 \le$  \$20, and  $2x_1 + 1.5x_2 + 0.5x_3 \le$  \$8.

$\max_{x_1, x_2, x_3, s_1, s_2, s_3}$	$c = 60x_1 + 30x_2 + 20x_3$
subject to	$8x_1 + 6x_2 + x_3 + s_1 = 48,$
	$4x_1 + 2x_2 + 1.5x_3 + s_2 = 20,$
	$2x_1 + 1.5x_2 + 0.5x_3 + s_3 = 8,$
	$x_1, x_2, x_3, s_1, s_2, s_3 \ge 0.$

We saw in the table (see slide 8) that the solution is:  $x_1^* = 2, x_2^* = 0, x_3^* = 8$ . The company is adding a new resource constraint:

$$x_1 + x_2 + x_3 \leq 11.$$

It satisfies the current solution:

$$2 + 0 + 8 = 10 \le 11$$
  $\sqrt{}$ 

We saw in the table (see slide 8) that the solution is:  $x_1^* = 2, x_2^* = 0, x_3^* = 8$ . The company is adding a new resource constraint:  $x_2 \ge 1$ . It doesn't satisfy the current solution:  $0 \ge 1$ .

The new constraint:

$$x_2 \ge 1 \implies -x_2 \le -1 \implies -x_2 + s_4 = -1$$

Note: we have used the dual simplex method above.

We saw in the table (see slide 8) that the solution is:  $x_1^* = 2, x_2^* = 0, x_3^* = 8$ . The company is adding a new resource constraint:  $x_1 + x_2 \ge 12$ . It doesn't satisfy the current solution:  $2 \ge 12$ . The new constraint:

----

 $x_1 + x_2 \ge 12 \implies -x_1 - x_2 \le -12 \implies -x_1 - x_2 + s_4 = -12.$ 

Note: we have used the dual simplex method above.

Therefore, it does not have a feasible solution!
